NeuroPace 2015-267	RNS System Post-Approval Study in Epilepsy Clinical Investigation Plan	Treatment	Burdette, David	Julie Reddy Julia.Reddy@spectrumhealth.org 616.486.2022

The purpose of this trial is to follow patients prospectively over 5 years in the real-world environment to gather data on the long-term safety and effectiveness of the RNS System at qualified CECs by qualified neurologists, epileptologists, and neurosurgeons trained on the RNS System. The RNS System is an adjunctive therapy in reducing the frequency of seizures in individuals 18 years of age or older with partial onset seizures who have undergone diagnostic testing that localized no more than two epileptogenic foci, are refractory to two or more antiepileptic medications, and currently have frequent and disabling seizures. Patients that have been implanted with the RNS System will follow-up in the clinic per their routine care schedule.
