Document reviewed: 12/7/20

Admit/Transfer

- Admit > 20 weeks gestation
- **Grand Rapids** - Admit to the OB service on antepartum floor with MFM consult. Consult ID if indicated.
- **Regions** – Admit to either the OB service with medicine consult or medicine with OB consult (varies by location).
- Admit < 20 weeks gestation – Admit to medicine service with OB consult
- **Grand Rapids**: Provider sends message to *SHMG Infectious Disease* through PerfectServe notifying ID about any Covid positive patient admitted. Notify charge nurse.
- **Regions**: Provider sends message to *Infectious Disease (ID)* and *Maternal-Fetal Medicine Primary (MFM)* through PerfectServe notifying ID and MFM about any COVID-19 positive patient admitted. Notify charge nurse.

General Admission Criteria for non-obstetrical related admission

1. Any Modified Early Warning Score (*MEWS*) triggers or sepsis (*qSOFA* score >1) – find both on MDcalc (see tables below)
2. Unable to tolerate PO
3. Symptoms of respiratory distress, including hypoxia and cyanosis
4. Hemoptysis and/or chest pain
5. Altered mental status, seizures, drowsiness, confusion, or coma
6. Inability to comply with treatment or follow up or inability to self-isolate (e.g. group setting or treatment facility)
7. Pneumonia on CXR or CT scan
8. Any of the signs or symptoms of moderate or severe illness (below).

Severity of Illness

Asymptomatic with + COVID-19 test / Mild Illness

- **Signs**: Vital signs not meeting MEWS criteria ([MEWS criteria calculator](#)) or sepsis criteria ([qSOFA](#) score >1). Patient can tolerate PO and care for themselves.
- **Symptoms**: fever, cough, nausea, vomiting, diarrhea, muscle aches, fatigue, conjunctivitis, headache, loss of smell, sore throat, bruising, joint pain.
- **Admission**: Admit patient for normal obstetrical indications to your unit. Otherwise discharge home. Normal care with severe respiratory precautions if admit. Transfer to Grand Rapids for current obstetrical indications. Patient with positive COVID-19 result and no to mild sx is not transferred to Grand Rapids.
Moderate Illness

- **Signs**: Tachypnea > 24, Saturations <92% and/or hemodynamic instability
- **Symptoms**: SOB (unable to walk across the room, speak full sentences), hemoptysis, chest pain, dehydration, decreased level of consciousness
- **Findings**: CXR or CT Chest consistent with pneumonia (ground glass opacities)
- **Admission**: These patients are admitted and can usually be admitted to your antepartum unit. Transfer to Grand Rapids for current obstetrical indications, gestational age ≥ 36 weeks, or progresses from mild to moderate/severe illness.

Severe Illness

- **Signs**: Tachypnea >30 bpm, saturations <90% or using >3L O2 and/or has hemodynamic instability
- **Symptoms**: Worsening clinical status
- **Admission**: These patients are admitted and usually require ICU level care.
  - **Grand Rapids** - Consult the MICU team to discuss if admission/transfer to MICU is appropriate.
  - **Regions** – Consult hospitalist team to discuss if admission/transfer to ICU is appropriate.
  - Transfer to Grand Rapids for current obstetrical indications or gestational age ≥ 36 weeks. If transfer to Grand Rapids is appropriate, MICU accepts transfer with an MFM consult.

MEWS Criteria
Calculate on Mdcalc.com using this link - MEWS link
You can add the SOFA (not qSOFA) score to your patient list as a column.

<table>
<thead>
<tr>
<th>qSOFA (Quick SOFA) Criteria</th>
<th>Points</th>
</tr>
</thead>
<tbody>
<tr>
<td>Respiratory rate ≥22/min</td>
<td>1</td>
</tr>
<tr>
<td>Change in mental status</td>
<td>1</td>
</tr>
<tr>
<td>Systolic blood pressure ≤100 mmHg</td>
<td>1</td>
</tr>
</tbody>
</table>
Symptoms present: Admit patient to Obstetrics ≥ 20 weeks or medicine if < 20 weeks if moderate or severe illness. (Do not follow for asymptomatic, COVID-19 + patients)

- **Baseline:** CMP, CBC (w/diff), CMP, CRP, D-dimer, ferritin, fibrinogen, LDH, triglycerides (.covid19 order), Mg/Phos, ABG, coags, G6PD, BNP and CXR;
- If sepsis suspected add procalcitonin, lactate and BCx/UCx/VagCx
- **Baseline and daily:** EKG
- Continuous O2 via nasal cannula; titrate to SpO2 ≥ 95% (surgical mask over nasal cannula)
- **Every 12 hours:** CBC (w/diff), CMP, and Mg/Phos
  - Trend ABG if RR>24 or SpO2<93%
  - Trend lactate if sepsis suspected

### With any new O2 requirement consider:
- Start **dexamethasone** (6mg BID x2d + 6mg qd x8d)
  - After dexamethasone for fetal lung maturity, can switch to methylprednisolone 32mg qd x 8d
  - Can discontinue early if hospital discharge occurs
  - May be more effective ≥ 7 days from initial symptoms
- Add **azithromycin** if evidence of pulmonary infiltrates; add ceftriaxone if evidence of pneumonia
- Start **remdesivir** (200mg IV x1d + 100mg IV QD x4 d)
- Other therapies per ID consultation (eg tocilizumab)
- Prone positioning for any patients with PaO2/FiO2 <150 mmHg for 2-3 hrs. per shift; NST before and after prone positioning

### For all COVID patients:
- No maintenance IV fluids; no boluses unless clear evidence of septic shock
- Consider dose of Lasix for patient that is normotensive and requires oxygen
- Start prophylactic Lovenox 40mg for VTE prophylaxis x 6 weeks total if postpartum or mod/severe dx; 10 days for asymptomatic or mild dx
- Consider using Magnesium sulfate regimen for neuroprotection if <32 weeks
- Use normal postpartum pain management regimen (NSAIDs are okay to use)

---

If using > 3L O2 or progressed to severe illness, see "admission" notes above under Severe Illness

**Discharge criteria:**
- Patient on room air, has mild symptoms
- If pregnant, reassuring fetal well being
- See full [Discharge Readiness Criteria](#) on InSite
